With extensive case studies for illustration, this is a practitioner's guide to an entirely new production system for construction management using flowline scheduling. Covering the entire process of presenting a comprehensive management system - from design, through measurement, scheduling, and visualization and control - its emphasis is on reducing cost and increasing quality. Drawing its components together into a management system, the authors not only include theory and explanations of how and why it works, but also examine and present a suite of methods for successful project implementation. Perfect as a how-to guide for researchers and advanced construction students to discover the simple application of the new techniques, and invaluable for acquiring the practical tools for planning and controlling projects.

This book adopts a methodical approach to the process of planning and control exercised by the contractor during the pre-tender, pre-contract and construction phases of projects through the application of various planning techniques to a number of case studies in both building and civil engineering. To develop a fundamental understanding of the factors which influence the successful management of time on projects, the book explores the implications of new forces that are changing the way the construction industry operates, including the 'Latham' culture and new health and safety legislation such as the Construction (Design and Management) Regulations. A number of planning applications are explained, including linked bar charts, networks and precedence diagrams, together with techniques used for repetitive projects, such as line of balance and time-chainage diagrams. The text also incorporates examples of contract budgetary control and cost-value reconciliation procedures.
