Recent experiments in mainland Europe and more recently the UK have found that removing the traditional separation between traffic and people in urban areas can make streets safer and less congested.

## **Improving traffic behaviour and safety through urban ...**

Shared space (Hamilton-Baillie and Jones, 2005), while still contested (Moody and Melia, 2014) is an urban realm improvement that seeks to reduce vehicle speed but then allow motor and other traffic to mix with pedestrians. Barriers, highway signs and road markings are replaced with subtle surface features, such as changes in colour and texture.

With half of the world's population now living in urban areas, and rapid urbanization continuing apace, it is essential that the growth of urban areas is supported by the development of adequate and sustainable infrastructure. This work offers comprehensive coverage of critical issues on the highway and urban environment which are key to understanding sustainability in the world's expanding urban areas.

The 9th Highway and Urban Environment Symposium (9HUES) was held in Madrid, Spain, from 9-11 June 2008. HUES is run by Chalmers University of Technology within the Alliance for Global Sustainability (The AGS). HUES was initiated by Professor Ron Hamilton at Middlesex Polytechnic (now University) in the early 1980s and had the title "Highway Pollution". The initial aim was to measure and assess challenges in highway pollution, with a strong emphasis on urban photochemical smog, ozone formation and particle release. After the first symposium, the emphasis on air pollution issues continued through to Munich in 1989 where diesel particulate issues and the relevance to health through measurements of PM10 emerged. The focus on air quality issues was also strengthened. In parallel, the symposium started to receive an increasing number of scientific contributions from the area of urban run off, indeed to the extent that the title of the symposium was changed to "Highway and Urban Pollution". Since then the importance of science in support of policy became increasingly important as a key aspect of the symposium. 9HUES was held at TRANSyT- Universidad Politécnic de Madrid, Spain to provide a professional and scientific

forum on global examples of the science required to support pathways to a positive and sustainable future in the highway and urban environment.

With half of the world's population now living in urban areas, and rapid urbanization continuing apace, it is essential that the growth of urban areas is supported by the development of adequate and sustainable infrastructure. This work offers comprehensive coverage of critical issues on the highway and urban environment which are key to understanding sustainability in the world's expanding urban areas.

Over half of the global population now lives in cities. This ongoing urbanisation is making it increasingly important to adequately manage urban systems and preserve urban environments. This book is the outcome of the 11th Urban Environment Symposium (UES) held on 16-19 September 2012 in Karlsruhe, Germany. The UES aims at providing a forum on the sciences and practices needed to promote a sustainable future in urban environments. Papers by leading experts are presented in sections on Urban Management and Spatial Planning, Green Cities and Urban Ecosystems, Urban Planning and Development, Air Quality and Noise, Urban Climate Change and Adaptation, and Contamination of Urban Waters and its Effects.

The U.S. Environmental Protection Agency (EPA) was introduced on December 2, 1970 by President Richard Nixon. The agency is charged with protecting human health and the environment, by writing and enforcing regulations based on laws passed by Congress. The EPA's struggle to protect health and the environment is seen through each of its official publications. These publications outline new policies, detail problems with enforcing laws, document the need for new legislation, and describe new tactics to use to solve these issues. This collection of publications ranges from historic documents to reports released in the new millennium, and features works like: Bicycle for a Better Environment, Health Effects of Increasing Sulfur Oxides Emissions Draft, and Women and Environmental Health.

The facts of Africa's rapid urbanisation are startling. By 2030 African cities will have grown by more than 350 million people and over half the continent's population will be urban. Yet in the minds of policy makers, scholars and much of the general public, Africa remains a quintessentially rural place. This lack of awareness and robust analysis means it is difficult to make a policy case for a more overtly urban agenda. As a result, there is across the continent insufficient urgency directed to responding to the challenges and

Opportunities associated with the world's last major wave of urbanisation. Drawing on the expertise of scholars and practitioners associated with the African Centre for Cities, and utilising a diverse array of case studies, Africa's Urban Revolution provides a comprehensive insight into the key issues - demographic, cultural, political, technical, environmental and economic - surrounding African urbanisation.
