Linear ball bearings and round shafts are often used in applications that call for ease of use and simple mounting requirements. For example, where profiled rail guides require full support along their length, linear ball bearings, or bushings, can be used in many applications with shafts that are supported only at their ends. However, unlike [1]

For most recirculating ball and roller linear guides, the allowable operating temperature range is -10° to 80° C, with some configurations rated up to 100° C for brief periods. But not all applications fall within this temperature range, and each component in the linear bearing assembly (housing, rail, balls, seals, etc.) has a different maximum [1]

The NB rotary ball spline has a cylindrical nut that rolls on the ball spline shaft. Rotary ball splines can be used for both rotational motion and linear motion, providing sub-millimeter accuracy every time. Popular applications include SCARA robots, the vertical shaft of assembly equipment, automatic tool changers, and loaders.

A roller rail guide of the same size, with load capacity of 24,000 N and applied force of 2000 N has a life of 395,600 km. In applications where ball rail guides would fail to provide sufficient life, or where the required size would be too large to be practical, roller rail guides can provide a solution.

Roller rail guides: Three reasons why you should use them

Linear bearings can be mounted on either square or round rail guides. For a square (profile) rail, it is important that the guides have perfect parallelism, otherwise it could cause binding or excessive wear. **Race:** This refers to the sliding contact points of the balls or rollers in a linear bearing. The point at which the balls/rollers touch the carriage is the outer race.

Linear ball and roller guides must be fully supported from either above or below. Whilst the roller linear guides offer higher load capacities, recent product development of the ball guides has narrowed the gap between their load capacities. Ball guides continue to be more popular than roller linear guides and consequently the prices tend to be lower. Where dirt is an issue, the track bearings are clearly the best solution.

Linear bearings and guides should be limited to around 20 feet or less. The components do not lend themselves to butt coupling, which makes exceeding 20 feet quite difficult. A wide range of linear bearings and guides exist. Some are stable in all directions while others can only handle moments around certain axes, e.g. yaw but not pitch.
