Almost all the cells in your body were produced by mitosis. The only exception is sperm or eggs which are produced by a different type of cell division called meiosis. During fertilization the sperm and egg unite to form a single cell called the zygote which contains chromosomes from both the sperm and egg.

Mitosis gives rise to almost all the cells in the body. A different type of cell division called meiosis gives rise to sperm and eggs. During fertilization the sperm and egg unite to form a single cell called the zygote which contains chromosomes from both the sperm and egg.

Mitosis and Fertilization - The Cell - NCBI Bookshelf In multicellular plants and animals, however, meiosis is restricted to the germ cells, where it is key to sexual reproduction. Whereas somatic cells undergo mitosis to proliferate, the germ cells undergo meiosis to produce haploid gametes (the sperm and the egg).

Mitosis and Meiosis: Mitosis and meiosis are both processes of cell division, in which one cell separates to produce two or more daughter cells.

**In a healthy biological male, when do mitosis and meiosis** :  
In sexual life cycles, meiosis and fertilization keep the number of chromosomes constant from generation to generation. Meiosis (2 of 3): The Mechanism (BioFix tutorial) diploid haploid Neither meiosis nor fertilization changes the ploidy level. Meiosis decreases the ploidy level from 2 n to n; fertilization does not change the ploidy level.

In this hands-on, minds-on activity, students use model chromosomes and answer analysis and discussion questions to learn about the processes of meiosis and fertilization. Students first analyze how the processes of meiosis and fertilization result in the alternation between diploid and haploid cells in the human lifecycle.

Mitosis involves the division of body cells, while meiosis involves the division of sex cells. The division of a cell occurs once in mitosis but twice in meiosis. Two daughter cells are produced after mitosis and cytoplasmic division, while four daughter cells are produced after meiosis.

**The Difference Between Mitosis and Meiosis**  
Mitosis occurs in somatic cells and meiosis occurs in reproductive cells. The basic difference is that mitosis results in the production of two daughter cells that are identical to the parent cell,...

Mitosis and Fertilization - Understanding How Genes Are Inherited! Almost all the cells in your body were produced by mitosis. The only exception is the gametes - sperm or eggs - which are produced by a different type of cell division called meiosis. Why your body can not use mitosis to make sperm or eggs

**Meiosis and Fertilization + gametes sperm or meiosis**  
So, gametes can not be made by mitosis. 3. Each human sperm and egg should have chromosomes, so fertilization will produce a zygote with chromosomes; this zygote will develop into a healthy embryo with chromosomes in each cell. 4. Each sperm and each egg produced by meiosis has only one chromosome from each pair of homologous chromosomes.
