To analyze mediation: 1. Follow Baron & Kenny ' s steps. 2. Use either the Sobel test or bootstrapping for significance testing. The following shows the basic steps for mediation analysis suggested by Baron & Kenny (1986). A mediation analysis is comprised of three sets of regression: X Y, X M, and X + M Y.

Another way a mediator can really test is to focus the person on, " What will be the possible outcomes if mediation fails? What then? " (BATNA and WATNA) If a person realizes that this outcome won ' t give them what they want – or think they want – they will be more open to alternatives. Likewise, if they walk through the consequences of failed mediation (such as going to court), they often see the value in reaching an agreement.

Bootstrapping is becoming the most popular method of testing mediation because it does not require the normality assumption to be met, and because it can be effectively utilized with smaller sample sizes (N < 25). However, mediation continues to be most frequently determined using the logic of Baron and Kenny or the Sobel test. It is becoming increasingly more difficult to publish tests of mediation based purely on the Baron and Kenny method or tests that make distributional assumptions such ...

The simplest mediation analysis involves a single independent variable, a dependent variable, and a hypothesized mediator. The unmediated model is represented by the direct effect of x on y, quantified as c. However, the effect of X on Y may be mediated by a process, or mediating variable M.

Social science data analysts have long considered the mediation of intermediate variables of primary importance in understanding individuals' social, behavioural and other kinds of outcomes. In this book Dawn Iacobucci uses the method known as structural equation modeling (SEM) in modeling mediation in causal analysis. This approach offers the most flexibility and allows the researcher to deal with mediation in the presence of multiple measures, mediated moderation, and moderated mediation, among other variations on the mediation theme. The wide availability of software implementing SEM gives the reader necessary tools for modeling mediation so that a proper understanding of causal relationship is achieved.

A must-have volume for every communication researcher ' s library, The SAGE Sourcebook of Advanced Data Analysis Methods for Communication Research provides an introductory treatment of various advanced statistical methods applied to research in the field of communication. Written by authors who use these methods in their own research, each chapter gives a non-technical overview of what the method is and how it can be used to answer communication-related questions or aide the researcher dealing with difficult data problems. Students and faculty interested in diving into a new statistical topic—such as latent growth modeling, multilevel modeling, propensity scoring, or time series analysis—will find each chapter an excellent springboard for acquiring the background needed to jump into more advanced, technical readings.

Lauded for its easy-to-understand, conversational discussion of the fundamentals of mediation, moderation, and conditional process analysis, this book has been fully revised with 50% new content, including sections on working with multicategorical antecedent variables, the use of PROCESS version 3 for SPSS and SAS for model estimation, and annotated PROCESS v3 outputs. Using the principles of ordinary least squares regression, Andrew F. Hayes carefully explains procedures for testing hypotheses about the conditions under and the mechanisms by which causal effects operate, as well as the moderation of such mechanisms. Hayes shows how to estimate and interpret direct, indirect, and conditional effects; probe and visualize interactions; test questions about moderated mediation; and report different types of analyses. Data for all the examples are available on the companion website (www.afhayes.com), along with links to download PROCESS. New to This Edition "Chapters on using each type of analysis with multicategorical antecedent variables. "Example analyses using PROCESS v3, with annotated outputs throughout the book. "More tips and advice, including new or revised discussions of formally testing moderation of a mechanism using the index of moderated mediation; effect size in mediation analysis; comparing conditional effects in models with more than one moderator; using R code for visualizing interactions; distinguishing between testing interaction and probing it; and more. "Rewritten Appendix A, which provides the only documentation of PROCESS v3, including 13 new preprogrammed models that combine moderation with serial mediation or parallel and serial mediation. "Appendix B, describing how to create customized models in PROCESS v3 or edit preprogrammed models.

This volume introduces the statistical, methodological, and conceptual aspects of mediation analysis. Applications from health, social, and developmental psychology, sociology, communication, exercise science, and epidemiology are emphasized throughout. Single-mediator, multilevel, and longitudinal models are reviewed. The author's goal is to help the reader apply mediation analysis to their own data and understand its limitations. Each chapter features an overview, numerous worked examples, a summary, and exercises (with answers to the odd numbered questions). The accompanying CD contains outputs described in the book from SAS, SPSS, LISREL, EQS, MPLUS, and CALIS and a program to simulate the model. The notation used is consistent with existing literature on mediation in psychology. The book opens with a review of the types of research questions the mediation model addresses. Part II describes the estimation of mediation effects including assumptions, statistical tests, and the construction of confidence limits. Advanced models including mediation in path analysis, longitudinal models, multilevel data, categorical variables, and mediation in the context of moderation are then described. The book closes with a discussion of the limits of mediation analysis, additional approaches to identifying mediating variables, and future directions. Introduction to Statistical Mediation Analysis is intended for researchers and advanced students in health, social, clinical, and developmental psychology as well as communication, public health, nursing, epidemiology, and sociology. Some exposure to a graduate level research methods or statistics course is assumed. The overview of mediation analysis and the guidelines for conducting a mediation analysis will be appreciated by all readers.

"Written in a friendly, conversational style, this book offers a hands-on approach to statistical mediation and moderation for both beginning researchers and those familiar with modeling. Starting with a gentle review of regression-based analysis, Paul Jose covers basic mediation and moderation techniques before moving on to advanced topics in multilevel modeling, structural equation modeling, and hybrid combinations, such as moderated mediation. User-friendly features include numerous graphs and carefully worked-through examples; "Helpful Suggestions" about procedures and pitfalls; "Knowledge Boxes" delving into special topics, such as dummy coding; and end-of-chapter exercises and problems (with answers). The companion website provides downloadable sample data sets that are used in the book to demonstrate particular analytic strategies, and explains how researchers and students can execute analyses using Jose's online programs, MedGraph and ModGraph. Appendices present SPSS, AMOS, and Mplus syntax for conducting the key types of analyses"--

"A comprehensive book on methods for mediation and interaction. The only book to approach this topic from the perspective of causal inference. Numerous software tools provided. Easy-to-read and accessible. Examples drawn from diverse fields. An essential reference for anyone conducting empirical research in the biomedical or social sciences"--

In this dissertation we consider different statistical methodologies to be employed at all stages of testing mediation claims. We begin by examining the relative performance of various methods of testing direct and indirect effects, both in terms of statistical power and the risk of Type I errors. Specifically, we compare a normal-theory approach to testing direct and indirect effects (Sobel, 1982) using either regression or structural equation models with different estimations to bootstrapping techniques (Efron, 2003). We then discuss factor models as an alternative model to mediation models for cases where they make conceptual sense, and as a method of examining worst-case confounding scenarios. We present formulae that discuss their relationships, and investigate the use of structural equation modeling as a way to distinguish between these two models. Finally, we investigate the utility of fungible weights (Waller, 2008) for examining parameter sensitivity in mediation. Fungible weights provide almost equal description of the dependent variable as do the optimal weights, yet may be quite discrepant with the optimal weights and suggest alternative interpretations. We also provide a function to facilitate their use.

How Mediation Works will introduce management and law students as well as businesses to this art of conflict resolution from the behavioral perspective, while also providing a valuable resource to continuing education programs, mediation training, and lawyers to familiarize clients with the mediation process.

Mediation Theory and Practice, Third Edition introduces you to the process of mediation by using practical examples that show you how to better manage conflicts and resolve disputes. Authors Suzanne McCorkle and Melanie J. Reese help you to understand the research and theory that underlie mediation, as well as provide you with the foundational skills a mediator must possess in any context, including issue identification, setting the agenda for negotiation, problem solving, settlement, and closure. New to the Third Edition: Expanded content on the role of evaluative mediation reflects the latest changes to the alternative dispute resolution field, helping you to distinguish between various approaches to mediation. Additional discussions around careers in conflict management familiarize you with employment opportunities for mediators, standards of professional conduct, and professional mediator competencies. New activities and case studies throughout each chapter assist you in developing their mediation competency.
